

# Tarp Manufacturing

Our tarps are Simply the Best because all are cut using a state of the art CNC cutting machine. This means whether you are ordering a straight tarp or a flap tarp, it will be cut to your exact specifications. All tarps are double stitched using Lock Stitch sewing machines, versus chain stitching, preventing the stitching from unraveling. All mesh tarps have heavy duty webbing sewn down the length of each side to prevent wear and tear along the edges.

Each tarp is individually numbered and kept on file to make reordering a breeze.

## Pulltarps Tarps

Our tarps for semi-automatic pull out style tarps have a 40 oz. wear patch at the back where the tarp comes in contact with the tailgate. This helps make the tarp last much longer than other brands of tarps. These tarps also use a hem tube sewn in each end to attach the tarp to the roller tube at the front and the pullrod at the rear.

## Arm System Tarps

Pulltarps Arm System tarps have a hem tube at the tailgate end that is part of our exclusive Double Wrap Teardrop Technology. The tarp slides into the groove in the Teardrop Pullbar and then the tarp is given a full wrap around the pullbar. This prevents the tarp from bunching and pulling to the center of the pullbar. Urethane Teardrop bumpers on each side of the tarp protect and quiet the entire system.

**New!!**

## Cable System Tarps

Our Cable System tarps feature premium 18 oz vinyl or heavy duty mesh fabrics. Mesh tarps have 2" wide heavy duty webbing sewn the full length down each side. The tarps include bow pockets for added strength and longer wear. Our Cable System tarps make great replacements for any brand of tarp system. A 14" straight rear flap is standard on our Cable Systems unless ordering a rear closer.
